CHARGE ATLAS / FIELD HYPOTHESES

5 field hypotheses; 0 investment-ready sites. Vendor estimates and author-selected stresses are not local forecasts.

Base payback ≤6 years; conservative ≤8 years from first spend; base NPV ≥0 at 10% real over 10 operating years; positive conservative steady cash and all six evidence gates. Chosen policy, not Tesla or industry criteria.

Property / exact address	Investigation rationale	Counter-evidence / required field test
WinCo Foods Puyallup 9518 176th Street East, Puyallup, WA 98375 Investigation tier A	First investigate a four-post retail site: 24-hour amenities and a larger nearby supply gap than the other urban WinCo options reviewed. This is an investigation priority, not a forecast of market share.	Home charging can dominate suburban demand. Road traffic, city EV registrations and a database gap do not establish paid charging demand. Utility territory, capacity and parking rights remain unverified. Match road counters to actual entrances; inspect turning access and nearby South Hill charging queues. Obtain comparable paid energy across seasons, then test incremental capture, complete four-post EPC cost and a written utility service offer.
H-E-B at Ronald Reagan Blvd 19348 Ronald W. Reagan Blvd, Georgetown, TX 78628 Investigation tier A	First investigate the Bar W retail and commuter catchment. Official amenities and the retained supply gap justify local validation; an overlapping Leander catchment must not be counted twice.	Tesla normalizes the address to Leander 78641; parcel matching remains unresolved. Store hours do not grant 24/7 charging access. Georgetown city EV totals are not this property's catchment. Resolve the vendor map point against the official parcel; validate home-charging availability and competing Leander capacity. Obtain host access terms, meter/utility identity, a complete quote and a local demand-transfer case.
Elgin H-E-B 1080 West Hwy 290, Elgin, TX 78621 Investigation tier B	Investigate corridor stopping demand after the access screen. Sparse inventory makes the US 290 hypothesis worth testing, but the same Texas vendor default is weaker evidence here than a local traffic/capture study.	Through traffic may be commuters charging at home. Elgin's city EV count is small. Planned road changes can undermine frontage access; no direct impact on this parcel has yet been established. Overlay current roadway concepts with the parcel and entrances before paying for design. Validate directional EV traffic, stopping need and attainable capture with matched paid analogues; do not multiply all traffic by city EV share.
WinCo Foods Edmonds 21900 Highway 99, Edmonds, WA 98026 Investigation tier B	Investigate expansion or redesign of an existing charging property. Recovered plans make a scope-matched cost check actionable; this is not a blank-market greenfield recommendation.	Historical design load is not spare capacity. Existing operator rights and nearby competition may defeat third-party entry. Reuse savings and incremental demand remain unproved. Identify current equipment, operator and host rights; obtain paid throughput and as-built condition. Compare a genuine upgrade quote with a new four-post build, including only assets demonstrably reusable.
WinCo Foods Medford 251 E Barnett Rd, Medford, OR 97501 Investigation tier B	Keep as a lower-priority redesign or recovery hypothesis. Existing project records create a useful diligence route, but the new vendor inputs make an unsubsidized full new build less attractive than the other four cases.	The reason for cancellation, current rights and reusable work are unknown. Nearby competition weakens incremental demand; the vendor utility proxy is higher than in the WA and TX examples. Resolve cancellation and asset rights before a new-build bid. Seek an owner-authorized utility assessment and an explicitly scoped restoration quote; separately verify any rebate and measured incremental demand.

Qualitative diligence priorities, not predicted-return ranks. Puyallup and Ronald Reagan first; Elgin requires an access screen; Edmonds and Medford require a redesign/recovery scope. The wider 37-site pool remains pending, not rejected. No site rights, complete quotes, firm utility capacity/date or calibrated paid-demand forecast has been obtained.

CHARGE ATLAS / WORKING CASES

5 field hypotheses; 0 investment-ready sites. Vendor estimates and author-selected stresses are not local forecasts.

Base payback ≤6 years; conservative ≤8 years from first spend; base NPV ≥0 at 10% real over 10 operating years; positive conservative steady cash and all six evidence gates. Chosen policy, not Tesla or industry criteria.

Property / vendor kWh/post/day	Conservative payback / NPV	Base payback / NPV	Optimistic payback / NPV	Base required kWh/post/day	Base maximum full capex
WinCo Foods Puyallup 298 kWh	No recovery* NPV −$498.5k	7.18 yr NPV −$52.3k	4.73 yr NPV $228.2k	359.1	$456.6k
H-E-B at Ronald Reagan Blvd 302 kWh	No recovery* NPV −$485.6k	6.88 yr NPV −$24.2k	4.55 yr NPV $264.1k	348.6	$479.7k
Elgin H-E-B 302 kWh	No recovery* NPV −$485.6k	6.88 yr NPV −$24.2k	4.55 yr NPV $264.1k	348.6	$479.7k
WinCo Foods Edmonds 298 kWh	No recovery* NPV −$498.5k	7.18 yr NPV −$52.3k	4.73 yr NPV $228.2k	359.1	$456.6k
WinCo Foods Medford 230 kWh	No recovery* NPV −$660.9k	No recovery* NPV −$289.1k	7.42 yr NPV −$74.0k	441.0	$262.1k

Four posts; demand 0.7/1/1.2 times vendor reference; gross capex $634.5k/$564k/$517k; monthly uncovered cost $2k/$1k/$0.5k. Flat demand, no grant, no residual. Construction 1.5/1/0.75 years; first-year ramp 50/75/100%; replacement 2/1.5/1%. Input details and boundary caveats are in the product. NPV in USD thousands. * No recovery within construction plus 10 operating years. Each inverse column changes only ONE input; never combine thresholds. Neither is a quote or a full-gate pass. Vendor utility prices include demand; assumed 15% loss borrows a different grid-to-battery boundary. Hardware taxes and full utility/civil/land scope remain unquoted.
