CHARGE ATLAS / LOCAL EVIDENCE

5 local reviews | 4 conditional tariff profiles | 0 investment-ready sites

Unchanged policy: base payback <=6 years; conservative <=8 years from first spend; base NPV >=0 at 10% real over 10 operating years; positive conservative cash and all six evidence gates.

Property / exact address	New public evidence	Decision change / remaining condition
H-E-B at Ronald Reagan Blvd 19348 Ronald W. Reagan Blvd, Georgetown, TX 78628	WCAD parcel R600635 matches the retailer address; appraisal owner is BAR W MARKETPLACE LLC. County and official retailer records support Georgetown 78628; a City of Austin record uses Leander 78641 for the same store #774. Sources 1 / 2 / 3 / 4	Parcel uncertainty reduced; electricity underwriting becomes more demanding. First priority remains conditional on a costed load profile. This reduces the postal-alias concern, not legal title, charging rights or validation of the vendor map point.
WinCo Foods Puyallup 9518 176th Street East, Puyallup, WA 98375	Pierce County provider polygons return PSE at the Ecology facility point. October 2026 Schedule 26 secondary charges include $0.121947/grid-kWh, $436.32/month, plus winter/summer demand of $17.47/$10.26 per kW-month. Sources 1 / 2 / 3 / 4	Retail hypothesis retained; ordinary high-demand tariff weakens the case. Prioritize tariff eligibility and peak design before treating this as a high-priority build. Mapped provider is conditional. Municipal taxes, reactive charges and special service terms are not priced; peak kW is assumed, not reserved capacity.
Elgin H-E-B 1080 West Hwy 290, Elgin, TX 78621	TxDOT US290 station 11H88 reports 40,613 AADT in 2025, versus 47,046 in 2024, about 274 m from the retained point. Sources 1 PUCT polygons intersect both Bluebonnet and Oncor. Official H-E-B uses WEST while CapMetro lists the same #475 store and phone with EAST. Sources 1 / 2 / 3 / 4	Road context is clearer, but utility overlap and parcel-level access still prevent a site-specific bill. Retain as conditional second priority. Neither an electricity provider nor engineering-record identity is resolved. Do not transplant PEC rates or merge older East-labeled engineering costs.
WinCo Foods Edmonds 21900 Highway 99, Edmonds, WA 98026	Snohomish PUD commercial EV rebate page specifies qualifying Level 2 ENERGY STAR equipment. Sources 1	Expansion/redesign hypothesis unchanged. The newly checked published commercial rebate is Level 2, not evidence of DCFC funding. Do not book this as DCFC capital support. This does not prove that no other support exists; existing operator rights, reusable assets and spare capacity remain unresolved.
WinCo Foods Medford 251 E Barnett Rd, Medford, OR 97501	Pacific Power allows qualifying upgrades/expansions subject to prior funding. For eligible ≥150 kW ports the rebate is up to 75% of qualifying cost, capped at $30,000/port and normally $100,000/site. Sources 1 / 2	Recovery/redesign hypothesis retained. A conditional upgrade rebate route is clearer, but Tesla equipment eligibility is not established. Four ports do not automatically earn $120,000. Larger amounts need preapproval; listed equipment/network and actual paid invoices are required. No affirmative Tesla V4 listing or award was established.

New local evidence narrows identity, utility and traffic questions. Retail analogues support testing demand, while current demand charges weaken generic low-electricity-cost cases. No site is investment-ready.

All 37 candidate decisions remain pending. No enforceable site rights, complete design-matched EPC quote, firm grid capacity/date or calibrated local paid-demand forecast was obtained. Road traffic and mapped service territory do not establish charging orders or available power. No awarded grant is booked.

CHARGE ATLAS / TARIFF SENSITIVITIES

5 local reviews | 4 conditional tariff profiles | 0 investment-ready sites

Unchanged policy: base payback <=6 years; conservative <=8 years from first spend; base NPV >=0 at 10% real over 10 operating years; positive conservative cash and all six evidence gates.

Utility SUBTOTALS, not full bills. Taxes, reactive power, bespoke charges and load-control costs remain unpriced. These are assumptions, not forecasts; positive results can overstate returns.

Conditional profile	Conservative Payback / NPV	Base Payback / NPV	Optimistic Payback / NPV	42 x 35 transfer Payback / NPV	Joint demand kWh/post/day	Base utility SUBTOTAL / year
H-E-B at Ronald Reagan Blvd PEC · 600 kW monthly / 150 kW 4CP	No recovery* NPV -$771.8k	9.91 yr NPV -$221.1k	5.60 yr NPV $94.4k	7.13 yr NPV -$47.2k	707.6	$91.8k
H-E-B at Ronald Reagan Blvd PEC · 600 kW monthly / 600 kW 4CP	No recovery* NPV -$959.0k	No recovery* NPV -$378.2k	7.30 yr NPV -$66.5k	9.62 yr NPV -$204.2k	822.8	$124.8k
WinCo Foods Puyallup PSE 26 secondary · 600 kW monthly peak	No recovery* NPV -$1,246.5k	No recovery* NPV -$699.6k	No recovery* NPV -$449.9k	No recovery* NPV -$565.0k	1,364.5	$167.5k
WinCo Foods Puyallup PSE 558 trial · 200 kW peak / 600 kW off-peak	No recovery* NPV -$920.5k	No recovery* NPV -$360.2k	7.10 yr NPV -$51.6k	8.99 yr NPV -$178.7k	800.3	$105.3k

Transfer and joint boundary. 42 sessions/site/day is reported grocery-adjacent analytics, not audited local orders. Assuming all sessions are paid and 35 kWh each gives 367.5 kWh/post/day on 4 posts. Paid mix, session energy and site comparability are unverified. The transfer holds base cost and tariff fixed; it is separate from the three scenarios.

Four posts. The unchanged v0.7 three scenarios set gross capital at $634,500 / $564,000 / $517,000; demand at 70% / 100% / 120% of the vendor reference. Published utility components are stressed by +25% only in the conservative case. No grants enter the scenarios. Joint required energy solves both base and conservative rules with downside energy at 70% of the base; it is an optimistic subtotal boundary because unpriced charges remain.

Conditions. PEC assumes uniform hourly energy and one full startup year before the 4CP transition; actual calendar and achieved 4CP require verification. PSE 26 assumes secondary service and the same 600 kW monthly maximum. PSE 558 enrollment is unapproved and capped; preserving sales under its 200/600 kW peak/off-peak limits requires a priced control/queue design. These profiles do not establish spare capacity.

NPV: USD thousands, 10% real discount, 10 operating years, no residual. Payback starts at first spend. * No recovery within construction plus 10 operating years. Joint demand is a lower, incomplete-cost boundary under paired base/downside rules, not observed demand or a full-gate pass. PSE's optional $160k capital case remains an unawarded, post-installation sensitivity; it is excluded above and includes no stacked grid-upgrade allowance.
